Data Life Cycle
During the Storm

Data Life Cycle
After the Storm

1 Conduct Post-Storm Analysis

After the storm is over, the NHC has to look at all of the data that were collected and get a clear picture of the life of the storm. Doing this means analyzing data from all different sources and determining which sources are the most accurate.

2 Document the Storm

Once the NHC has analyzed the storm, they need to coherently document the storm for the sake of history and future reference. At this time, the NHC creates what they call a Tropical Cyclone Report for the storm. This report documents everything they know about the storm from start to finish. The NHC also creates something called the "best track" data set. This data set represents the most accruate record of the storm's path and strength at 6 hour intervals throughout its life.

3 Publish to the Data Archive

The last thing the NHC needs to do is publish their report and data to the NHC Data Archive. This makes all of the information that the NHC has collected about the storm open to the public. These data and reports are important resources for disaster relief organizations and future storm modelers.
